MANUAL

VINTAGE TONE CONTROL (VTC) RETROFIT KIT

Vintage Tone Control (P/P) / Treble and Bass (stacked)

Thank you for purchasing your Sadowsky[®] Vintage Tone Control (VTC) Retrofit Kit! The VTC kit is the perfect upgrade for older Sadowsky[®] models without the tone control and stacked potentiometer for treble and bass. If you do not have experience with wiring or soldering, or if you are unsure how to proceed with the installation, we strongly recommend that the installation is performed by a professional guitar technician.

The Sadowsky[®] Vintage Tone Control (VTC) Retrofit Kit includes a tandem potentiometer for treble and bass, a push/pull potentiometer for the passive tone control and all necessary assembly parts. The VTC control is passive, the maximum setting is a flat EQ. The further you turn the control down, the more the high end in the signal will be attenuated. Slightly attenuated treble minimizes the string noise, heavily damped treble creates a classic Motown / Flatwound sound.

Note: The manufacturer reserves the right to change these specifications without notice.
